

From the project SimpleTests, running the SimpleItemTest.TestMethod1, I get these results:

Notice the grey dots. From the test, it should simply fail, but it's never run. If I set a break point on the string value = null line, it never stops in debug, which suggests that something is throwing off the Test Runner prior to getting into the tests.

I would switch to NUnit or MbUnit, but my co-developers are bound into the MS way...

I'm open for suggestions, as I expect this to be some combination of "loaded X, unloaded Y, unloaded X" leaving some residual junk behind. I'm just not sure where to clear this out. Unloading EVERYTHING then reloading is at least a half-day effort, which I'd like to avoid if I can.

Thanks much!!
